Pune.**

ACKNOWLEDGEMENT

The project “**RideEzy**” is a great learning experience for us and we are submitting our work to Advanced Computing Training School (CDAC ACTS), Pune.

We are glad to mention name of *Ms. Harshita Mam* for her valuable guidance on this project. Her guidance and support helped us to overcome various obstacles and intricacies during the course of project work.

We are highly grateful to Ms. Joshi Mam co-ordinate Infoway CDAC, Pune, for her guidance and support whenever necessary during our course Diploma in *Advance Computing (E-DAC)* through Infoway , Pune.

From:

Mr. Rushikesh Goli	(220343120091)
Mr. Saurabh Jayraj Gaware	(220343120096)
Mr. Akash Balaji Pandole	(220343120068)
Mr. Ajay Gurpadappa Shete	(220343120004)

1. Introduction of Project:

As much as we like to travel or move to new places either for the purpose of study or work we are constantly worried about one thing, How I travel from one place to another. Where will I find a good Vehicle or Driver for traveling? In this web application we tried to provide a one best solution to all these problems.

The main objective of this project is to integrate drivers and vehicle owners such that drivers will get employment as their primary income even if they do not have their own vehicle but having proper driving skills.

On the other side the person who has commercial vehicles like cars can get passive income while they are not using their vehicle.

The people who do not own any such commercial vehicle but if for a while they need one car, for them no need to request some people directly. They can get vehicles on rent along with the drivers if needed.

This web application provides information of vehicle or driver or both vehicle and driver online with your location on one platform. A user can look for a vehicle and driver based on his specialties and location.

2. Product Overview and Summary

- To bring driver (who is looking for a driving job), vehicle owner (who is willing to generate passive income) and customer/user (who need vehicles on rent for a while) at one centralized platform.
- To provide employment for skilled drivers
- To generate passive income for the people who have mobility assets.
- To provide special service to the people (customers) i.e. easy mode of travel with rental car.
- To save hectic situation for vehicle owner in searching trusted driver.

Modification and improvement over the existing Implementation:

Present State: Currently there are lots of private companies provide such service to the customers almost in all regions of INDIA. But there is no such platform which integrate both vehicle and driver. Our platform provide these services.

After implementation of project: After this project the person who owns vehicle do not have to worry about renting his/her vehicle because he can upload his information on our website the he/she can get employment. And also skilled driver who don't have vehicle the he/she can upload his information on our platform and can get employment.

With this project the normal customer/user, vehicle owner and driver are bring into a single centralized system. Driver will be become self employed based on his contract with the business. Vehicle owner gets a passive income. The normal person(customer/user) will get car or trip very easily at ground level.

Project Plan:

No. of User's and Modules:

Users: 1.Admin 2.Driver 3.Vehicle Owner 4.Customer/User

Modules:

1. Admin Module:

Admin will be provided with the dashboard from where he will be able to monitor all other modules. Dashboard will consist of four major modules such as Drivers, Vehicle Owner, Customer, Reviews and Feedback(Future Scope).

Admin will receive notifications when other users such driver, vehicle owner register on website.

2. Driver Login Module:

In this module driver will be able to see about his account details. He will be able edit his profile details, can change settings provided by the website. Driver will see all the details about his work i.e. his recent trips, reviews and ratings or any other related details.

Driver will be notified in this module when any user select the driver for the trip such detail will be shown in Active trips or New trips tab.

3. Customer Login Module:

In this module customer will see all the details related to his/her activity on this websites such as recent get information of, or he/she will be able to do get information of.

4. Vehicle Owner Login Module:

In this module the vehicle owner will be able to see the information about his vehicles such as get information of done for his/her vehicle, which trips and his live income as decided in business deal i.e. current earnings. He/she can add other vehicle or return the vehicle from the service.

Feasibility Study

It is important to analyze whether it is feasible to develop a project or not and that can it be completed in given time or not.

Before developing and implementing a system we have to make sure that the system is feasible in the following ways

- 1. Technical Feasibility**
- 2. Operational Feasibility**
- 3. Economical Feasibility**

1. Technical Feasibility:

In this type of feasibility study, the system analyst has to check whether it is possible or not to develop the requested system with availability of manpower, software, hardware, etc.

2. Operational Feasibility:

In this type of feasibility study the operation implementation of the system is considered. Checking is done regarding whether it is feasible for the user department to use the framework. Thus, the proposed system is said to be operationally feasible only if the clients are able to understand the system clearly and correctly and can use the system with ease.

3. Economical Feasibility:

In this type of feasibility study, the benefits of the system to the organization are considered by taking into consideration the cost-benefit analysis. The minimal requirement for this is a computer and an internet connection, which is available to everyone nowadays. Also, with the basic understanding user can use this system, thus reducing the training cost to the organization

Overall Description:

Product Features

The main feature of this system is that the users can get information of the vehicle or driver from nearby location. This is beneficial for user as it saves their precious time & efforts. Users can also look for driver with less efforts.

User Classes

There are two types of user to this system:

- 1.) **Admin:** Admin can add or remove users, additionally admin can remove vehicles as well driver from application. He/she also maintains the overall system.
- 2.) **User:** User can find a vehicle with driver availability if he/she want for particular time slot of their convenience nearby location. User also can enroll self as driver for income purpose and also add his vehicle for making the massive income from the app.

- **Challenges To Get information of Vehicle/Driver Online To and Through Existing System –**

- 1. Single Platform Multiple Get information of Types -** If you are willing to Add multiple types of Drivers or vehicles on Website then, It Has to definitely require an option to select Proper information of Vehicle/Driver type as per Application requirement.
- 2. Slot Management Close Get information of -** What if you are planning a vacation & want to prevent Hectic Travelling & need to get information of Vehicle/Drivers on specific days? If this is the case, you definitely require a system that lets you close certain dates to avoid get information of on those dates. Let's understand this with a live example :- Suppose you run an online Vehicle Management business. You want to get close information of some of your vehicles as the Vehicles under Repair or Servicing Requirement. So, this can only be achieved if you get information of system & will have this feature to restrict get information of on specific days.
- 3. Get information and Cancellation Option for Customers -** It's always been challenging to manage & get Absolute information of driver and vehicle on a single platform .If you provide the information option to customers, you will frequently receive tons of get information and cancellation requests from the customers that are too complex to manage. On the other hand, if you will not provide the cancel option to your customers, you will be flooded with Request or probably start receiving spams. This may also result in a large number of no-shows if the customers find no option to cancel. So, it's beneficial to have a system in such a way that customers can request the Admin/Company to cancel their Requirement rather than offering them a direct cancel option. One thing you can do is just restrict Details for the customer based on their emails.
- 4. Price Per Get information of Time Slot Management -** It's quite complex to manually set up a different price for each Vehicle/Driver slot. In order to have a flexible price for each Vehicle/Driver, your online system should be capable enough to show a different slot price of the

same Vehicle/Driver of Service on different dates. Let's understand it with a simple example. One Live example you might have observed:— You see a little variation in the price of the Vehicle Booking if you book the Car on week-days and if you book them on weekends. This means that the Booking service provided to you is the same but the slot price varies based on the slot you select. **How is it profitable?** People mainly prefer to Travel on weekends. So, you can keep up the Vehicle Price price high for the weekend & earn more from each Booking. It's been quite clear that your Booking of system must provide the option to create [price rules](#) based on which you can set a different slot price for the same product or services.

5. **Streamline Online information of Process** - Don't let your User confused once they visit your website to schedule appointments online. This is ultimately a real-time interaction between you & your user who visit your website to have look on the products or services. So, it's always been challenging to identify the bottlenecks that eventually leads to an obstacle for the online system. Just pick them out & build up your system in such a way that users find it a cakewalk to Look for services on your website. Thus, streamline your get information of process and provide a better experience for your customers.
6. **Handle Customer Complaints** - If you are in an eCommerce business, you have to deal with customer complaints. Your customer may have a bad experience with your service but the main challenge is to handle such situations with grace. Sometimes, you may come across such situations when your customer is having an incorrect assumption regarding your product or service. So, it's important to know their concerns, acknowledge their problems and provide them a satisfactory solution for their problems. And for this, you need to provide the option on your get information of website from where customers can raise their issues.

Wrapping Up -

Despite all the above challenges, the online industry is booming at a very higher pace. People rely more on online to get information of whether it's a flight, movie ticket get information of, hotel get information of or **get information of Vehicle/Driver**. So, if We are willing to establish a stable, powerful and profitable online get information of system, We need to find out a profitable way to overcome these challenges and get a boost to Our online sales & revenue growth.
